The objective is to develop a control model for controlling such systems using a control action in an optimum manner without delay or overshoot and ensuring control stability. To do this, a controller with the requisite corrective behavior is required. This controller monitors the controlled process variable (PV), and compares it with the reference or set point (SP).

In studying control systems the reader must be able to model dynamic systems in mathematical terms and analyze their dynamic characteristics. A mathematical model of a dynamic system is defined as a set of equations that represents the dynamics of the system accurately, or at least fairly well.

~~Mathematical Modeling of Control Systems~~

Design of control system means finding the mathematical model when we know the input and the output. The following mathematical models are mostly used. Differential equation model; Transfer function model; State space model; Let us discuss the first two models in this chapter. Differential Equation Model. Differential equation model is a time domain mathematical model of control systems. Follow these steps for differential equation model. Apply basic laws to the given control system.

Systems engineering is an interdisciplinary field of engineering and engineering management that focuses on how to design, integrate, and manage complex systems over their life cycles. At its core, systems engineering utilizes systems thinking principles to organize this body of knowledge. The individual outcome of such efforts, an engineered system, can be defined as a combination of components that work in synergy to collectively perform a useful function. Issues such as requirements engineeri
