Geochemistry - an overview | ScienceDirect Topics

Geochemistry is fundamentally concerned with the occurrence and distribution of the chemical elements in the Earth, with stronger emphasis on processes occurring in the upper continental crust. Mineralogy involves the identification and characterization of minerals occurring in pure form or as solid-state mixtures in rocks.

Geochemists study the composition, structure, processes, and other physical aspects of the Earth. They examine the distribution of chemical elements in rocks and minerals, as well as the movement of these elements into soil and water systems. There is a wealth of information buried in the liquids, gases, and mineral deposits of rock.

Geochemistry - American Chemical Society

Isotopic geochemistry has several principal roles in geology. One is concerned with the enrichment or impoverishment of certain isotopic species that results from the influence of differences in mass of molecules containing different isotopes.
